

Stop advanced threats on Salesforce and eliminate cyber risk

Salesforce platform plays an essential role in helping you run your operations, but also opens new attack vectors for cyber criminals. While Salesforce provides infrastructure security, it's important to note that as a shared cloud security responsibility, protecting the data going in and out of Salesforce is your responsibility.

WithSecure™ Cloud Protection for Salesforce helps safeguard your cloud environment against advanced cyber threats in real-time. All incoming and outgoing files and URLs are scanned for ransomware, malware, viruses, trojans, and phishing links. You get constant visibility into your content security status and can hunt threats with comprehensive reports and analytics.

The bespoke solution is designed in collaboration with Salesforce ensuring that it's perfectly integrated with the platform. You can also easily integrate it to your SIEM. Our click-and-go solution helps you protect your data according to shared cloud security responsibilities without tedious deployment projects.

Ward-off and hunt threats on your Salesforce cloud:

✓ Advanced Threat Protection

- High-fidelity detections of known and unknown malware
- Protection against phishing links
- Powered by multi-stage content analysis, real-time threat intelligence, AI, and sandboxing

✓ Real-time protection and visibility

- Automated scanning on upload and download
- Flexible on-demand and scheduled scans
- Click-time URL protection against dormant and mutating cyber threats
- Real-time visibility with full forensics trail for threat hunting

✓ Click-and-go security – made with Salesforce

- Natively integrated, purpose-built in close collaboration with Salesforce
- No single point of failure, no additional middleware, connectors, configuration hassle, or additional hosting costs
- Up and running in minutes giving you instant value

How WithSecure™ Cloud Protection for Salesforce keeps your environment safe

1. Your user uploads files or URLs to your Salesforce platform, for example, via web forms, community portals, emails, or third-party applications. The user could be an attacker slipping in phishing links or malicious files disguised as something benign.
2. WithSecure™ Cloud Protection for Salesforce intercepts and scans all entering and leaving content for threats using multi-stage content analysis process. Your data stays in Salesforce – only files that require deep behavioral analysis are sent to a cloud-based threat analysis platform encrypted and anonymized with zero user information.
3. If a threat is detected, your admins are automatically alerted, and the end-user is notified that content was blocked, advised on what to do next, and further use of the content is prevented.
4. Your incident response is sped up by advanced security analytics with full audit trails. Your security team can see what has happened and investigate efficiently.
5. You can easily integrate metadata, alerts, and workflows to your SIEM or other third-party security systems.

Co-secure the world with us

WithSecure™ is cyber security's reliable partner. Our experience and capability, developed over 30 years, protects more than 140,000 businesses around the world. Businesses across industries trust us for outcome-based cyber security to protect and enable their operations. As an end-to-end cyber security house, we offer comprehensive threat hunting and consulting services, and develop our award-winning security technologies with a deep understanding that our in-house research unit and hands on field experience provides.
